

Intersection Stack

Intersection Stack

- > **Intersection Stack**—A sliding, center-pivoting top-hung divider system that allows paired panels to pivot and stack against each other all along the track system.
- > **Intersection Stack** utilizes aluminum profiles and hardware that have been created specifically for Stack. A floor guide track is recommended but not required for the overall function of the paired panels.
- > **Intersection Stack** panels can be designed to function as presentation boards, acoustic room dividers, or architectural design elements in almost any environment.
- > **Intersection Stack** offers CPS porcelain steel markerboards, glass markerboards, decorative glass panels, decorative wood or mesh panels or Acoustikor panels which are non-porous, anti-microbial or sanitize-able materials.
- > **Intersection Stack** is flexible and can be configured to meet almost any requirement; and is aesthetically compatible with all other Intersection Products.

And because it's based on Intersection, integrating the great variety of existing materials along with many new and custom components is easy.
